Introduction

- Over the last year, IEEE has taken steps towards 50G single-lane, 100G dual-lane and 200G quad-lane standardization
  - First “Flash mob” in May 2015
  - CFI in Nov 2015
  - First Study Group meeting in Jan 2016
  - First Task Force (P802.3cd) meeting in May 2016
- P802.3cd is currently establishing technical baselines for a 50/100/200G standard
  - Complete set of technical baselines scheduled to be available in Sept 2016
- P802.3cd Task Force approved PCS/FEC technical baseline at July 2016 meeting
- The intent of this presentation is two-fold:
  - Propose an architecture for 64GFC based on the existing 32GFC and 128GFC standards, with updates reflecting the PCS/FEC technical baseline adopted by P802.3cd
  - Highlight the differences between the 64GFC PCS/FEC and 32GFC PCS/FEC as documented in FC-FS-4
