American National Standard for Information Technology

Fibre Channel - NVMe (FC-NVMe)

Secretariat

Information Technology Industry Council

Approved (not yet approved)

American National Standards Institute, Inc.

Abstract

This standard describes the frame format and protocol definitions required to transfer commands and data between a NVM Express host and NVM Express subsystem using the Fibre Channel family of standards.

American National Standard

Approval of an American National Standard requires review by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgement of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made towards their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and under no circumstance gives an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

PATENT STATEMENT

The developers of this standard have requested that holders of patents that may be required for the implementation of the standard disclose such patents to the publisher. However, neither the developers nor the publisher have undertaken a patent search in order to identify which, if any, patents may apply to this standard. As of the date of publication of this standard, following calls for the identification of patents that may be required for the implementation of the standard, notice of one or more such claims has been received. By publication of this standard, no position is taken with respect to the validity of this claim or of any rights in connection therewith. The known patent holder(s) has (have), however, filed a statement of willingness to grant a license under these rights on reasonable and nondiscriminatory terms and conditions to applicants desiring to obtain such a license. Details may be obtained from the publisher. No further patent search is conducted by the developer or publisher in respect to any standard it processes. No representation is made or implied that this is the only license that may be required to avoid infringement in the use of this standard.

Foreword (This Foreword is not part of American National Standard INCITS 540-201x.)

This standard defines a Fibre Channel mapping layer (FC-4) that uses the services defined by INCITS Project 545-D, Fibre Channel Framing and Signaling Interface - 5 (FC-FS-5) to transmit command, data, and status information between an NVMe host and an NVM subsystem. The use of the standard enables the transmission of standard NVMe command formats, the transmission of standard NVMe data and control, and the receipt of NVMe status across the Fibre Channel using standard Fibre Channel frame and Sequence formats. The NVMe protocol operates with Fibre Channel Class 3 Service, and operates across Fibre Channel fabrics. This standard was developed by Task Group T11.3 of Accredited Standards Organization INCITS during 2014-201x. The standards approval process started in the standard.

Requests for interpretation, suggestions for improvements or addenda, or defect reports are welcome. They should be sent to the INCITS Secretariat, Information Technology Industry Council, 1101 K Street, NW Suite 610, Washington, DC 20005.

This standard was processed and approved for submittal to ANSI by the International Committee for Information Technology Standards (INCITS). Committee approval of the standard does not necessarily imply that all committee members voted for approval.

At the time it approved this standard, INCITS had the following members:

Introduction

FC-NVMe defines a mapping protocol for applying the NVM Express interface to Fibre Channel. This standard defines how Fibre Channel services and specified Information Units (IUs) are used to perform the services defined by the M Express interface specification.

American National Standard for Information Technology —

Fibre Channel — NVMe (FC-NVMe)

1 Scope

This standard defines applying protocol for applying the NVM Express over Fabrics interface to Fibre Channel. This standard defines how the Fibre Channel services and the defined Information ts (IUs) are used to perform the services defined by the NVM Express over Fabrics interface specification.

2 Normative References

2.1 Overview

The following standards contain provisions that, through reference in the text, constitute provisions of this standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this standard are encouraged to investigate the possibility of applying the most recent editions of the standards listed below.

For electronic copies of ANSI and INCITS standards, visit ANSI's Electronic Standards Store (ESS) at http://www.ansi.org. For printed versions of most standards listed here, contact Global Engineering Documents, 15 Inverness Way East, Englewood, CO; 80112-5704, (800) 854-7179.

Orders for ISO Standards and ISO publications should normally be addressed to the ISO member in your country. If that is impractical, ISO Standards and ISO publications may be ordered from ISO Central Secretariat (ISO/CS):

Phone +41 22 749 01 11
Fax +41 22 749 09 47
E-mail sales@iso.org
Post ISO, 1, rue de Varembé, CH-1211
Geneva 20, Switzerland

In order to avoid delivery errors, it is important that you accurately quote the standard's reference number given in the ISO catalogue. For standards published in several parts, you should specify the number(s) of the required part(s). If not, all parts of the standard will be provided.

Copies of the following documents may be obtained from ANSI, an ISO member organization:

- a) approved ANSI standards;
- b) approved and draft international and regional standards (ISO and IEC); and
- c) approved foreign standards (JIS and DIN).

For further information, contact the ANSI Customer Service Department:

Phone +1 212-642-4900 Fax: +1 212-302-1286 Web: http://www.ansi.org E-mail: ansionline@ansi.org

or the InterNational Committee for Information Technology Standards (INCITS):

Phone 202-626-5738 Web: http://www.incits.org E-mail: incits@itic.org

Additional availability contact information is provided below as needed.

2.2 Approved references

2.3 References under development

At the time of publication, the following referenced standards were still under development. For information on the current status of the documents, or regarding availability, contact the relevant standards body or other organization as indicated.

3 Definitions and conventions

3.1 Overview

For FC-NVMe, the following abbreviations, acronyms, definitions, conventions, symbols, and keywords apply.

3.2 Abbreviations and acronyms

Abbreviations and acronyms applicable to this standard are listed. Definitions of several of these items are included in 3.3.

BLS **Basic Link Service** CQE mpletion Queue Entry tended Link Service **ELS** FC-FS-5 Fibre Channel - Framing and Signaling - 5 FC-GS-8 Fibre Channel - Generic Services - 8 FC-LS-3 Fibre Channel - Link Services - 3 FC-SP-2 Fibre Channel - Security Protocols - 2 FC-SW-7 Fibre Channel - Switched Fabric - 7 FLOGI Fabric Login IU Information Unit LS_ACC Link Service Accept reply frame LS_RJT Link Service Reject reply frame least significant bit lsb **LSB** least significant byte msb most significant bit **MSB** most significant byte NVMe **NVM Express BSY** N_Port Busy PLOGI N_Port Login **PRLI** Process Login SGL Scatter Gather List SQE bmission Queue Entry 3.3 mmon definitions

Note 1 to entry: See NVMe over Fabrics revision 1.0.

3.3.2 Data Series

3.3.1 (ca) sule

set of NVMe_DATA IUs that make up the total data transfer for a particular command

3.3.3 FC Port

port capable of transmitting and receiving Fibre Channel frames

NVMe unit of information hange used in NVMe over Fabrics

Note 1 to entry: See FC-FS-5.

Note 1 to entry: See -LS-3.

3.3.5 LBA data

data read from or written to NVMe storage device

3.3.6 LS_ACC

Link Service Accept

Note 1 to entry: See -LS-3

3.3.7 LS_RJT

Link Service Reject

Note 1 to entry: See LS-3.

3.3.8 metadata

contextual information about particular LBA data

Note 1 to entry: See NVM Express revision 1.2.1.

3.3.9 Name_Identifier

64-bit identifier, with a 60-bit value preceded with a 4-bit Network_Address_Authority Identifier, used to identify entities in Fibre Channel (e.g., N_Port, node, F_Port, or Fabric)

Note 1 to entry: See FC-FS-5.

3.3.10 Node Name

Name_Identifier (see 3.3.9) associated with a node

Note 1 to entry: See FC-FS-5.

3.3.11 NVMe connection

relationship between an Me host and a particular NVM subsystem, controller, and Queue

3.3.12 NVMe controller

Note 1 to entry: See NVM Express revision 1.2.1.

3.3.13 Me_Port

Nx_Port that supports the Fibre Channel NVM Express over Fabrics protocol

3.3.14 N_Port

device port that generate minates FC-4 traffic

3.3.15 **N_Port_ID**

topology unique address identifier of an Port

Note 1 to entry: See FC-FS-5.

3.3.16 N_Port_Name

Name_Identifier (see 3.3.9) that identifies an N_Port (see 3.3.14)

3.3.17 PLOGI

N_Port Login

Note 1 to entry: See LS-3.

3.3.18 SSY N_Port Busy

Note 1 to entry: See FC-FS-5.

3.3.19 SGL data data onto by an L

3.4 Editorial conventions

In FC-NVMe, a number of conditions, mechanisms, sequences, parameters, events, states, or similar terms are printed with the first letter of each word in uppercase and the rest lowercase (e.g., Exchange, Sequence). Any lowercase uses of these words have the normal technical English meanings.

Lists sequenced by letters (e.g., a-red, b-blue, c-green) show no ordering relationship between the listed items. Numbered lists (e.g., 1-red, 2-blue, 3-green) show an ordering relationship between the listed items.

In case of any conflict between figure, table, and text, the text, then tables, and finally figures take precedence. Exceptions to this convention are indicated in the appropriate clauses.

In all of the figures, tables, and text of this document, the most significant bit of a binary quantity is shown on the left side. Exceptions to this convention are indicated in the appropriate clauses.

Data structures in this standard are displayed in Fibre Channel format (i.e., "big-endian"), while specifications originating in NVMe over Fabrics display data structures in Ethernet format (i.e., "little-endian").

If the value of the bit or field is not relevant, then x or xx appears in place of a specific value. If a field or a control bit in a frame is specified as not meaningful, then the entity that receives the frame shall not check that field or control bit.

Numbers that are not immediately followed by lower-case b or h are decimal values.

Numbers immediately followed by lower-case b (xxb) are binary values.

Numbers or upper case letters immediately followed by lower-case h (xxh) are hexadecimal values.

In figures, dashed components or bracketed components are optional.

3.5 Symbols

Unless indicated otherwise, the following symbol has the listed meaning.

!= not equal

3.6 Keywords

3.6.1 ignored: A keyword used to describe an unused bit, byte, word, field or code value. The contents or value of an ignored bit, byte, word, field or code value shall not be examined by the receiving device and may be set to any value by the transmitting device.

- **3.6.2 invalid:** A keyword used to describe an illegal or unsupported bit, byte, word, field or code value. Receipt of an invalid bit, byte, word, field or code value shall be reported as an error.
- **3.6.3 mandatory:** A keyword indicating an item that is required to be implemented as defined in this standard.
- **3.6.4** may: A keyword that indicates flexibility of choice with no implied preference (equivalent to "may or may not").
- **3.6.5** may not: A keyword that indicates flexibility of choice with no implied preference (equivalent to "may or may not").
- **3.6.6 optional:** A keyword that describes features that are not required to be implemented by this standard. However, if any optional feature defined by this standards is implemented, then it shall be implemented as defined in this standard.
- **3.6.7 reserved:** A keyword referring to bits, bytes, words, fields and code values that are set aside for future standardization. A reserved bit, byte, word or field shall be set to zero, or in accordance with a future extension to this standard. Recipients should not check reserved bits, bytes, words or fields for zero values. Receipt of reserved code values in defined fields shall be reported as an error.
- **3.6.8 shall:** A keyword indicating a mandatory requirement. Designers are required to implement all such mandatory requirements to ensure interoperability with other products that conform to this standard.
- **3.6.9 should:** A keyword indicating flexibility of choice with a strongly preferred alternative; equivalent to the phrase "it is strongly recommended".
- **3.6.10 x** or **xx**: The value of the bit or field is not relevant.

4 General

4.1 Structure and concepts

re Channel (FC) is logically a point-to-point serial data channel. The architecture has been designed so that it may be implemented with high performance hardware that requires little real-time software management. The Fibre Channel Physical layer (FC-2 layer) described by FC-FS-5 performs those functions required to transfer data from one Port to another. In this standard, Ports capable of supporting NVMe over FC transactions are collectively referred to as TVMe_Ports. The FC-2 layer is a delivery service with information grouping and defined classes of service.

A switching fabric allows communication among more than two NVMe_Ports.

An FC-4 mapping layer uses the services provided by FC-FS-5 to perform the functions defined by the FC-4. The protocol is described in terms of the stream of FC and Exchanges generated by a pair of NVMe_Ports that support the FC-4.

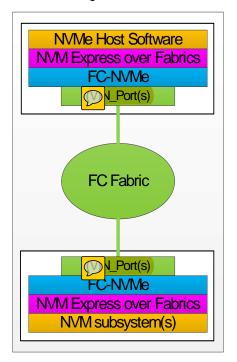

detailed implementation that supports that stream is not defined by this standard. Originator and responder NVMe_Ports are assumed to have a common service interface, for use by all FC-4s, that is similar in characteristics to the service interface defined in FC-FS-5.

s standard defines the following kinds of functional management:

- a) rice management;
- b) Process Login and Process Logout management; and
- c) link management.

The NVMe over FC protocol defines the mapping of the over Fabrican the Fibre Channel interface (see FC-FS-5). Link control is performed by standard rC-FS-5 protocol. The I/O operation defined by NVMe over FC is mapped into a Fibre Channel Exchange. A Fibre Channel Exchange carrying information for an NVM Express over Fabrics I/O operation is an NVMe over FC Exchange. The request and response initives of an I/O operation are mapped into Information Units (IUs) as specified in table 32 and table 33.

NVMe over FC protocol layers are shown in figure 1.

ure 1 – NVMe over FC protocol layers

The FC-NVMe protocol layer is specified in this standard, the NVM Express over Fabrics protocol are is specified in the NVM Express over Fabrics protocol and the NVMe Host Software and subsystem(s) protocol layer is specified is in the NVM Express cification.

The NVMe over FC target device functional model is shown in figure 2.

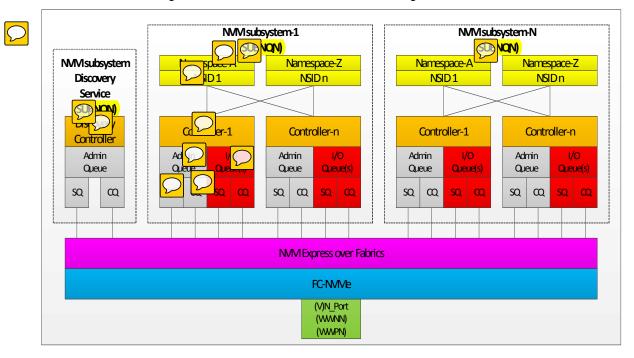

Figure 2 – NVMe over FC target device functional model

The mapping of NVM Express over Fabrics to NVMe over FC is specified in table 1.

Table 1 – NVM Express over Fabrics and NVMe over FC mapping

NVM Express over Fabrics	NVMe over FC equivalent	Reference
I/O operation	Exchange	FC-FS-5
	Data Series	4.11

The number of Exchanges that may simultaneously be open between an initiator NVMe_Port and a target NVMe_Port is defined by the FC-FS-5 implementation. The architectural limit for this value is 535. The maximum pher of active Sequences that may simultaneously be open between an initiator NVMe_Port and a target NVMe_Port is restricted by the allowable range of values of the Sequence ID to 256 (see FC-FS-5)

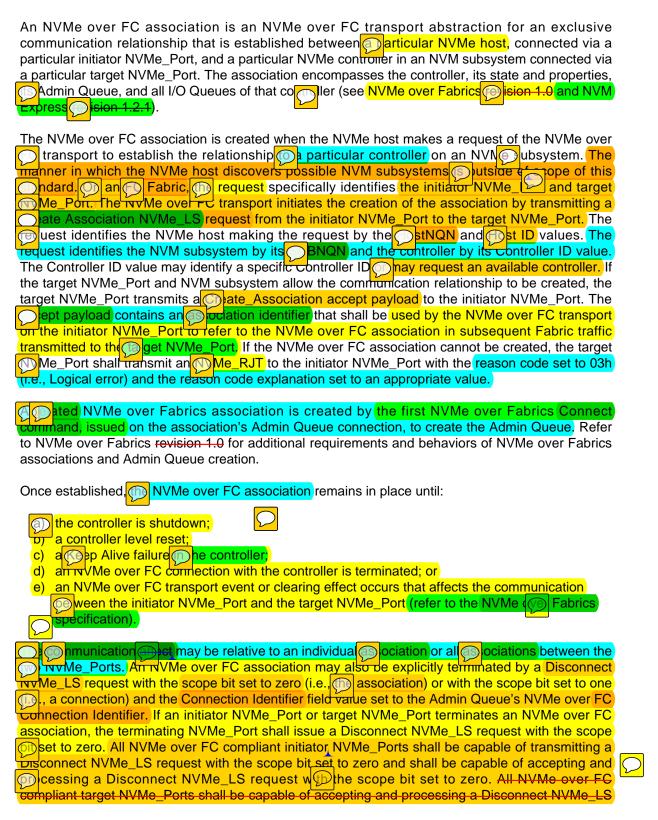

4.2 NVMe over FC ports

A target NVMe_Port corresponds to a physical interface connecting VM subsystem to an FC price target NVMe_Port is a NVM subsystem port for a particular NVM subsystem. The target NVMe_Port may provide the specific to a particular NVM subsystem. As NVM subsystem Port IDs (see table 40 e specific to a particular NVM subsystem and assigned by that NVM subsystem, a single target NVMe_Port providing connectivity for multiple NVM subsystems may be seen as multiple NVM subsystem ports with the same, or differing NVM subsystem Port ID values.

initiator NVMe_Port corresponds to a physical interface connecting an NVMe host to an FC rapric. The initiator NVMe Port may provide Fabric connectivity for one or more NVMe hosts.

4.3 NVMe over FC association

INCITS 540-201x Fibrannel - NVMe Rev 1.14 December 7, 2016 uest with the scope bit set to zero and shall be capable of transmitting a Disconnect NVMe_LS equest with the scope bit set to zero. If a NVMe over FC association is terminated, the NVMe over FC transport on the initiator NVMe Port or target NVMe_Port shall implicitly terminate all Admin Queue and I/O Queue connections for the (as lociation. The <u>stroller shall be terminated and/or</u> cleared according to the semantics defined in invime over Fabrics ision 1.0 and NVM Express ision 1.2.1. If a target NVMe_Port receives a NVMe_LS request that does not correspond to an active NVMe ever FC association, the target NVMe_Port shall not process the NVMe_LS request and shall nsmit an NVMe_RJT with the reason code set to 40h (i.e., Invalid Association ID) and the reason code explanation set to 00h (i.e., No additional explanation). NVMe over FC connection NVMe over FC connection is an NVMe over FC transport abstraction representing an NVMe Shd eue (SQ) and Me Completion Queue (CQ) for a Me controller. The controller toentified by the were FC association. An NVMe over FC connection may correspond to the controller's Admin Queue or an I/O Queue on that controller. An NVMe over FC connection corresponding to the Admin Queue is created simultaneously with the oation of the NVMe over FC association as part of the processing of the Create Association Me_LS request. The Create Association NVMe_LS request specifies size of the Admin SQ, m ch is also the size of the Admin CQ, as well as the SP_Ratio manually the periodic delivery Me_ERSP IUs for completion uccessful creation of the NVMe over FC association shall also melude ation of the resources the NVMe over FC connection for the controller's Admin Queue (i.e., Stand CQ). The atte Association pept payload specifies a Connection Identifier that shall (iii) used by the NVMe over FC transport on the initiator NVMe_Port to refer to the controller's Admin aueue in subsequent pric traffic transmitted to the target NVMe_Port. pated NVMe controller Admin Queue is created by the first NVMe over Fabrics Connect

over Fabrics ision 1.0 for additional requirements and behaviors of Admin Queue creation.

NVMe over FC connection corresponding to an I/O Queue is created when the NVMe host makes

NVMe over FC connection corresponding to an I/O Queue is created when the NVMe host makes a request of the NVMe over FC transport to establish the transport connection for an I/O Queue for a particular controller. The NVMe over FC transport initiates the creation of the transport connection by transmitting a request I/O Connection NVMe_LS request from the initiator NVMe_Port to the target NVMe_Port. The request payload specifies the connection is to be established for as well as:

- a) the I/O Queue ID it corresponds to;
- b) the size of the Queue's SQ (which is also the size of its CQ); and
- c) the ERSP_Ratio mandating the periodid pivery NVMe_ERSP IUs for completions.

If the target NVMe_Port and NVMe controller accept the request, the target NVMe_Port transmits a pate I/O Connection ept paylear the initiator NVMe_Port. The accept yload contains a pnection Identifier that shall be used the NVMe over FC Transport on the initiator NVMe_Port to the NVMe over FC connection in psequent Fabric traffic transmitted to the target NVMe_Port (e.g., Me over FC I/O commands).

NVMe over FC connection cannot be created, the target NVMe_Port shall transmit an NVMe_RJT to the initiator NVMe_Port with the reason code set to 03h (i.e., Logical error) and the reason code explanation set to an propriate value. Ditted NVMe controller I/O Queue is created by the first NVMe over Fabrics Connect command <mark>ued</mark> on the NVMe over FC connection for the controller's I/O Queue. See NVMe over Fabrics (a) ision 1.0 for additional requirements and behaviors of I/O Queue creation. Once established, the NVMe over FC connection remains in place until the NVMe over FC as coiation is terminated, or a transport error occurs that causes loss of a message or loss of data in ray that the NVMe over FC transport cannot recover (see NVMe over Fabrics revision) (i.e., Me I/O operation to the loss) or a SQE, CGE or data for an Nyme command, All cause the corresponding NVMe over FC connection to be terminated). An NVMe over FC commection may also be explicitly terminated by a connect NVMe_LS request with the cope bit set to one (i.e. a connection) and the Connection ntifier field set to the value for the libe over FC connection to be terminated. If an initiator nv/Me_Port or target NVMe_Port terminates an NVMe over FC connection, the terminating NVMe_Port shall issue a Disconnect NVMe_LS request with the Scope set to one and the over FC compliant initiator (Me_Ports shall be capable of transmitting a Disconnection Me_LS request with the Scope se pone and shall be capable of accept and processing a Disconnect Me_LS request with the Scope set to one. All NVMe over FC compliant between NVMe_Ports shall be capable of accepting and processing a Disconnect NVMe_LS request with the Scope set to one and shall be capable of transmitting a Disconnect NVMe_LS request with the Scope set to one. termination of an NVMe over FC connection implicitly terminates the NVMe over Fabrics association with the controller be implicitly terminating the controller's NVMe over FC association (see NVMe over Fabrics () islon 1.0). If an NVMe over FC connection is terminated, as the connection represents the NVMe Queue, the termination of the place also causes all outstanding NVM commands on the Queue to be implicitly terminated (see NVIVI Express Sision 1.2.1). Thus, the termination of the NVMe over FC connection shall cause the NVMe over FC transport on the initiator NVMe_Port arget NVMe_Port to implicitly terminate all outstanding NVMe over FC I/Os that are associated with the NVMe over FC connection. each outstanding Me over FC I/O operation on the connection, the initiator NVMe_Port shall trahsmit an ABTS-L5 to terminate the Exchange for the 🕡 operation. If an NVMe over FC connection is terminated on a target NVMe_Port, the target NVMe_Port shall, for each outstanding NVMe over FC I/O operation on that connection, transmit an ABTS-LS to terminate the Exchange for the I/O operation. target NVMe_Port receives an Me_LS request with a Connection Identifier that does not correspond to an active NVMe over FC connection, the target NVMe_Port shall not process the Me_LS. If an NVMe_LS request with a Connection Identifier for an optive NVMe over FC the reason code set to 41h (i.e., Invalid Connection ID) and the reason code explanation set to 00h (i.e., No additional Planation). If an NVMe IU with a Connection Identifier for an intive NVMe over FC connection is received, the target NVMe_Port should transmit an ABTS-LS for corresponding Exchange.

Association ID) and the reason code explanation set to 00h (i.e., No additional explanation). If the

4.5 NVMe over FC I/O operations

When an NVMe host submits a command for processing by the controller, the command is submitted a Submission Queue Entry (SQE) and an associated trace which then submits the command to the Me over FC transport. The NVMe over FC

transport rences the transport the square transport to the square the square transport to the square transport transpo	
initiator NVMe_Port begins the NVMe over FC I/O operation by allocating an Exchange resource and associating the NVMe command in the SQE to the Exchange. All NVMe IUs for the NVMe nmand shall be transmitted as part of Exchange. The initiator NVMe_Port creates a Me_CMND IU for the Exchange. The NVMe_CMND IU payload conveys a single SQE (i.e. NVMe command) from the NVMe host to the NVMe controller via the NVMe over FC Connection (i.e., SQ). NVMe_CMND IU specifies the Connection Identifier for the NVMe over FC connection, structured by the SQE is being submitted to. The NVMe_CMND IU also takes and characteristics of data to be transferred by command. Me over FC Transport neglectors using FC-FS-5 services to perform the command.	
pe initiator NVMe_Port transmits the NVMe_CMND IU payload to start the NVMe over FC I/O operation. The Exchange that is started is identified by its qualified Exchange identifier (XID) during the remainder of the NVMe over FC I/O operation and is used only for the IUs associated with that NVMe over FC I/O operation.	
controller interpreted the command is determined that a write operation is required, then the target NVMe_ror insmits a descriptor IU containing the Me_XFER_RDY IU payload to the initiator NVMe_ror incating which portion of the data is to be transferred. The initiator Me_Port in transmits plicited data IU to the target NVMe_Port containing the NVMe_DATA payload requested by the NVMe_XFER_RDY IU. Data delivery requests containing nvMe_XFER_RDY IU and returning NVMe_DATA IU payloads continue until the data transfer requested by the command is complete. One NVMe_DATA IU shall follow each NVMe_XFER_RDY IU. If the initiator NVMe_Port and target NVMe_Port have negotiated to disable the initial NVMe_XFER_RDY IU, then a burst burs	
controller has interpreted the command and has determined that a read operation is required, target NVMe_Port transmits plicited data IU containing the NVMe_DATA IU payload to the initiator NVMe_Port. Data deliveries containing the NVMe_DATA IU payloads continue until all data described by the command is transferred.	
After all the data has been transferred and command processing is completed the target NVMe_Port transmits a response III. The response IU conveys an NVMe CQE which is ates the completion and and in some cases, possible in pletion payload (see NVMe over price isien 1.0 and NVM Express isien 1.2.1). The response IU shall a NVMe_RSP or IVVMe_ERSP IU payload. The NVMe_ERSP IU payload transferred by the NVMe over FC transport as well as a CQE containing the completion status of the NVMe command and isible completion payload. The NVMe_RSP IU is used to convey an implied E with successful command completion with any additional completion data of zeros, as well as IVVMe_Port shall convert the NVMe_RSP IU into a CQE with successful command status and zeros for completion data.	
n error was detected in the processing of any of the nmand NVMe IUs, including the response the initiator NVMe_Port shall terminate the NVMe over FC connection that the command was assued to. If the Exchange for the command is still open the initiator NVMe_Port shall transmit an ABTS-LS.	
o error was detected in the processing of the command's NVMe IUs, including the response IU, and the target NVMe_Port requested confirmed completion (see 4.10), then the initiator NVMe_Port	

of any of the command NVMe IUs, including the response IU, and the Exchange was terminated either by the reception of the response IU with the LS bit set to one or by transmission of the NVMe CONF IU with the LS bit set to one, then the initiator NVMe Port shall deliver the CQE received or implied by the response IU to the NVMe CQ associated with the NVMe over FC connection that was specified in the NVMe CMND IU.

Me over FC takes full advantage of the multiplexing and shared bandwidth capabilities provided by Fibre Channel classes of service protocol is designed to operate with Class 3 service and to provide options for reliable error detection and error recovery.

NVMe initiator port function may exist in any NVMe_Port and the NVMe target port function may exist in any NVMe_Port. For NVMe over FC I/O operations between a host and a NVM subsystem, host cally takes on the NVMe initiator port role and the NVM subsystem cally takes on the vvMe target port role.

4.6 First burst

oth the initiator NVMe_Port and target NVMe_Port port a First Burst Supported bit (see e) value of on the initiator NVMe_Port may choose to perform the initiator NVMe_Port may choose to perform the initiator NVMe_Port may a preceding Me_XFER_RDY IU. The target NVMe_Port may a or discard the first NVMe_Data IU. If the target NVMe_Port accepts the first NVMe_DATA IU	ccept
the target NVMe_Port shall use NVMe_XFER_RDY IU(s) to request the transfer of any remainstance.	
te date ny. If the target NVMe_Port discards the first NVMe_DATA IU, then the t	arget
mvMe_P(Light all use NVMe_XFER_RDY IU(s) to request retransmission of mite data originally	y sent
in the first NVMe_DATA IU as well as only remaining write date initiator NVMe	Port
in the first NVMe_DATA IU as well as any remaining write date that initiator NVMe shall support retransmission of write data originally sent in the VVMe_DATA IU.	
ither the initiator NVMe_Port require the use of NVMe_XFER_RD	Y IUs
during write operations (i.e., First a Supported bit is set to zero), then the initiator NVMe	_Port
shall not send a first NVMe_DATA IU without receding NVMe_XFER_RDY IU, and the	

NVMe_Port shall tra hit NVMe_XFER_RDY iors) requesting each NVMe_DATA IU(s) to perform the write data transfer.

4.7 In-order delivery requirements and behavior

4.7.1 Overview

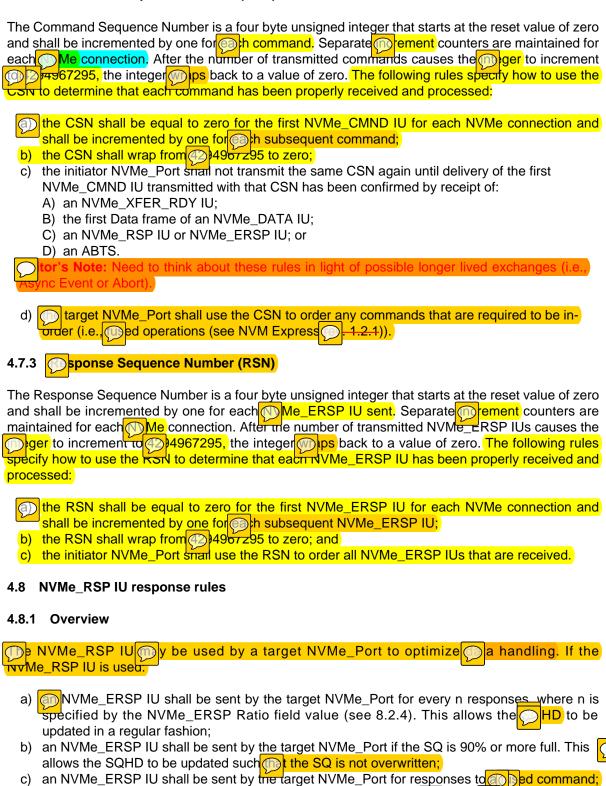

NVMe_Ports and Fabrics shall provide in-order delivery of frames in an Exchange.

ne NVMe commands are required to be processed in the order they were sent by the initiator (i.e., rused operations (see NVM Express 1.2.1)). To allow these commands to be processed in the order they were sent, (n) he case that the order was not maintained by the Fabric, the Command Sequence Number is used (see 4.7.2).

NVMe responses, all NVMe_ERSP IU responses are required to be processed in the order that they were sent. To allow the NVMe_ERSP IU to be processed in order, he case that the order was not maintained by the Fabric, the Response Sequence Number is used (see 4.7.3).

There is no ordering requirement for the NVMe_RSP IU. The NVMe_RSP IU shall be processed by the NVMe_Port soon as it is received. For an NVMe_RSP, a CQE shall be generated as specified in 4.8.2.

4.7.2 Command Sequence Number (CSN)

d) an NVMe_ERSP IU shall be sent by the target NVMe_Port if the ponse CQE

nead Pointer (SQHD) (bytes 09:08) nen-good completion status);

tains a non-zero value in any location other than Command ושׁל (כוֹם) (bytes 13:12) and SQ

- e) an Me_ERSP shall be sent by the target NVMe_Port if the Transferred Data Length field value is not equal to the NVMe_CMND IU Data Length field value; and
- f) NVMe_ESP may be sent by the target NVMe_Port for any other reason when deemed necessary by the target NVMe_Port.

4.8.2 NVMe RSP CQE fields

For commands completed by an NVMe_RSP IU, NVMe CQE shall be erated follows:

- a) SQHD to ue received from the last SQHD sent to the NVMe er;
- b) Command_ID set to value sent in inal NVMe SQE; and
- c) all other fields set to zero.

4.9 NVMe_ERSP IU response rules

If a command is completed by an NVMe_ERSP IU with a Status Code field value of 00h (i.e., NE) and the Transferred Data Length field value is equal to the later NVMe_Port's transfer byte ont, then the command shall be completed by delivery of the Call contained within the NVMe_ERSP IU to the Me layer.

command is completed by an NVMe_ERSP IU with a Status Code field value other than 00h (i.e., NE) or with a Transferred Data Length field value that is not equal to the initiator NVMe_Port's instead of the initiator NVMe_Port's instea

4.10 Confirmed completion of NVMe over FC I/O operations

Some implementations require an acknowledgment of successful delivery of NVMe_RSP IU or NVMe_ERSP IU information (i.e., confirmed completion). Such an acknowledgment is provided by uesting an NVMe_CONF IU. The Confirmed Completion Supported bits in the PRLI ELS request Me over FC Service Parameter page (see 6.3.3) and PRLI ELS accept NVMe over FC Service Parameter page (see 6.3.4) are used to obtain the support for confirmed completion.

If an initiator NVMe_Port and a target NVMe_Port the support confirmed completion, then a target NVMe_Port may request an NVMe_CONF IU by not setting the Last_Sequence bit to one (see FC-FS-5) in the last frame of an NVMe_RSP IU or NVMe_ERSP IU. Upon detecting the NVMe_CONF IU request, the initiator NVMe_Port shall transmit an NVMe_CONF IU to the target NVMe_Port, indicating to the target NVMe_Port that the NVMe_RSP IU or NVMe_ERSP IU has been received by the initiator NVMe_Port.

Confirmed completion provides a confirmation that the initiator NVMe_Port and the target NVMe_Port both agree upon te of a state dependent device.

onfirmed completion may assist NVMe initiator devices and NVMe target devices in many environments. Examples include:

- a) confirmed completion may be used to confirm that an initiator NVMe_Port has received an Me_ERSP IU reporting a non-Successful Completion status, together with accompanying auditional data. Upon receiving the NVMe_CONF IU, the target NVMe_Port may discard its copy of the proportion data;
- b) confirmed completion may be used to confirm that a command has been completed and that the completion information has been successfully transferred to the initiator NVMe_Port. That

allows subsequent state dependent operations to be performed, since the NVMe_CONF IU comments that the NVMe_RSP IU or NVMe_ERSP IU has been received by the initiator NVMe_Port; and

c) confirmed completion may be used to confirm that an initiator NVMe_Port has received the Me_RSP IU or NVMe_ERSP IU for target NVMe_Ports that require state dependent synchronization with initiator NVMe_Ports.

4.11 Data transfer

4.11.1 Overview

NVMe over Fabrics (see NVMe over Fabrics revision 1.0) specifies two types of data transfers:

- a) in-capsule data; and
- b) SGL data.

capsule data is data transferred within the capsule. SGL data is data specified by a list of memory regions. All data transfers for NVMe over FC shall be converted to Data Series transfers (see figure 3). In order to map NVM Express fabric data transfers onto NVMe over FC subclause specifies rules for pw types of NVMe over Fabrics data transfers:

- a) in-capsule data:
- b) SGL data for writes; and
- c) SGL data for reads.

4.11.2 In-capsule data

pointers to the offset into the Data Series. The format of these pointers are specified in NVM Express (see NVM Express ision 1.2.1).

4.11.3 SGL data

4.11.3.1 Overview

NVMe over Fabrics defines a mechanism for transmitting SGLs across a Fabric. Fibre Channel does not send SGLs across the Fabric (e.g., transmission over Fabrics revision 1.0), thus SGLs shall be converted to data sent within a Data Series for transmission across a Fibre Channel Fabric.

4.11.3.2 SGL mapping

An NVMe SGL is a list of memory regions to be gathered by the receiving NVMe controller. In order for data referenced by an SGL to be transferred via NVMe over FC tollowing shall occur:

- a) on a the data pointed to by the SGL shall be placed into a Data Series;
- b) on a delta, the data shall be placed into a Data Series by the NVMe controller; and
- c) both read and write, the SGL data field within the SQE shall be replaced by an offset into the bata Series and the length of the data (see 4.11.3.3).

An SGL example is shown in figure 3.

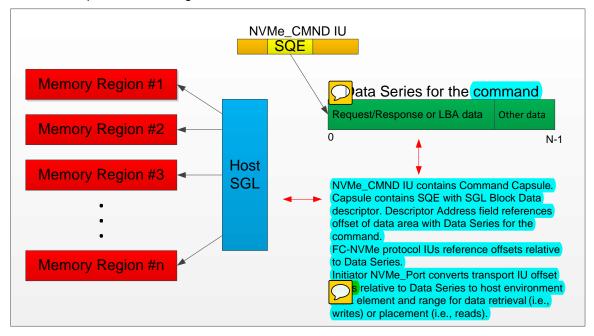

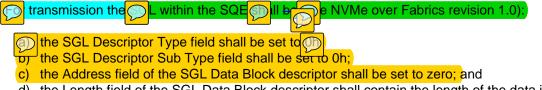

Figure 3 - SGL example

4.11.3.3 SGL entry format

d) the Length field of the SGL Data Block descriptor shall contain the length of the data in the Data Series.

4.12 Covery of NVMe over FC capabilities

umber of NVMe over FC capabilities require the knowledge and agreement of both the target Me_Port and the initiator NVMe_Port that such capabilities or shall be used. Table rovides references to the discovery process for each of the NVMe over FC capabilities.

ple 2 – Discovery of NVMe over FC capabilities

Capability	Discovery mechanism	Reference
Initiator NVMe_Port	Process Login	6.3
Target NVMe_Port	Process Login	6.3
Discovery Service	Process Login	6.3
Confirmed Completion Supported	Process Login	6.3
First Burst Supported	Process Login	6.3

4.13 Clearing effects of NVMe over FC, FS-5, and FC-LS-3 actions

Table 3 and table 4 summarize the clearing effects resulting from Fibre Channel link actions and NVMe over FC operations, respectively. The clearing effects are applicable only to puences and Exchanges associated with NVMe over FC operations follow rules specified in FC-FS other relevant protocol standards. Rows indicating a clearing effect for all initiator NVMe_Ports are link that attaches the initiator NVMe_Port to the target NVMe_Port.

Clearing effects of link related actions are specified in table 3.

Table 3 - Clearing effects of link related actions

FC link action						
Clearing effect	Target Po	LOGO ELS ^b , PLOGI ELS	PRLI ELS PRLO ELS ^b ,	TPRLO ELS ^a	ABTS-LS	(Sequel

set to zero For all initiator Only for initiat Me_Port associated with the action					

Key:

- "Y" indicates the clearing effect upon successful completion of the specified action.
- "N" indicates the clearing effect is not performed by the specified action.
- ndicates the clearing effect is not applicable.
- a) Exchanges are cleared internally within the target NVMe_Port, but open NVMe over FC quences shall be individually aborted by the initiator NVMe_Port using ABTS-LS. This has the effect of aborting the associated NVMe over FC Exchange.

4.14 togin/Logout

The N_Port Login (PLOGI) ELS ionally used to establish the Fibre Channel operating ameters between any two Fibre Channel ports, including NVMe_Ports. Implicit login functions are amowed.

If a target NVMe_Port receives a PLOGI ELS request and it finds there are not enough login resources to complete the login, then the target NVMe_Port shall respond to the PLOGI ELS with LS_RJT and Reason Code "Unable to perform command request" and Reason Code Explanation "Insufficient resources to support Login" as defined in FC-LS-3. By means outside the scope of this standard, the target NVMe_Port may select another initiator NVMe_Port and release some login resources by performing an explicit logout of the other initiator NVMe_Port, thus freeing resources for a future PLOGI ELS.

5 Process Login and Process Logout

The Process Login (PRLI) ELS request used to establish the NVMe over FC operating relationships between two NVMe_Ports (see o.3). The Process Logout (PRLO) ELS request is used to establish the NVMe over FC operating relationships between two NVMe_Ports (see 6.4).

pricit Process Login and Process Logout parameters may be defined for NVMe_Ports. Such usernitions are outside the scope of this standard.

4.16 Link management

FC-FS-5 allows management protocols above the FC-FS-5 interface to perform link data functions. The standard primitive sequences, link management protocols, BLSs, and ELSs are used as required by NVMe over FC devices (see FC-FS-5 and FC-LS-3).

4.17 NVMe over FC addressing and Exchange identification

The address of each NVMe_Port efined by its address identifier as described in FC-FS-5.

Each NVMe over FC association is prified by the Association Identifier created by a successful Create Association NVMe_LS requestion to the Association Identifier is valid as long as the NVMe over FC association is active.

Each NVMe over FC connection is identified by the Connection Identifier create v a successful Create Association NVMe_LS request or Create I/O Connection NVMe_LS request he Connection Identifier is valid as long as the NVMe over FC connection is active.

exchange identifier (FQXID). The FQXID is composed of the initiator port identifier, the target port identifier, the OX_ID field value, and the RX_ID field value ther definitions of FQXID are outside the scope of this standard. The method used to identify NVMe or FC I/O operations internal to the host and the controller is not defined by this standard.

mespace Identifiers are contained in the NVM Submission Queue Entry field of NVMe_CMD IUs. Subsequent identification of the NVMe over FC I/O operation and the Exchange that carries the protocol interactions for the NVMe over FC I/O operation uses the FQXID.

4.18 Use of Worldwide_Names

As specified in FC-FS-5, each Fibre Channel node shall have a Node_Name that is a Worldwide_Name and each Fibre Channel port shall have an N_Port_Name that is a Worldwide_Name. The Worldwide_Name shall be unique within the FC-NVMe interaction space using one of the formats defined by FC-FS-5. Each target NVMe_Port and its associated NVM subsystems have knowledge of the N_Port_Name of each initiator NVMe_Port through the Fibre Channel login process.

The FC-NVMe interaction space is the set of Fibre Channel ports, devices, and Fabrics that are connected by a Fibre Channel administrative/management entity, or are accessible by a common instance of a Fibre Channel administrative tool or tools.

TE 1 – WWN uniqueness between separate FC-NVMe interaction spaces is outside the scope of this standard.

Worldwide_Name for the NVMe_Port shall be different from the Worldwide_Name for the node (n.e., the N_Port_Name shall be different than the Node_Name).

5 FC-FS-5 Frame Header

The format of the NVMe over FC Frame_Header is specified in table 5.

Table 5 - Me over FC Frame_Header

Bits Word	31		24	23	••	16	15		08	07	••	00

1	CS_C	TL/Pr	iority	S_ID								
2	7	TYPE		F_CTL								
3	SEQ_ID				F_CT	L			SEQ	_CNT		
4	OX_ID			RX_ID								
5		Parameter										

All fields in the NVMe over FC Frame_Header the standard FC-FS-5 definitions. The following explanations of the fields provide information about the use of those fields to implement NVMe over FC functionality.

R_CTL: The R_CTL field is subdivided into a ROUTING field and an INFORMATION field (see FC-FS-5). The ROUTING field shall be set to 0h (i.e., Device_Data) and the INFORMATION field shall be set to the value specified in table 32 and table 33.

D_ID: The value in the D_ID field is the D_ID of the frame. For NVMe over FC FC-4 Device_Data frames, the D_ID transmitted by the Exchange Originator is the address identifier of the target NVMe_Port. The D_ID transmitted by the Exchange Responder is the address identifier of the initiator NVMe_Port.

CS_CTL/Priority: The values in the CS_CTL/Priority field are defined by FC-FS-5 for class specific control information or priority and not interact with the NVMe over FC protocol.

S_ID: The value in the S_ID field is the S_ID of the frame. For NVMe over FC FC-4 Device_Data frames, the S_ID transmitted by the Exchange Originator is the address identifier of the initiator NVMe_Port. The S_ID transmitted by the Exchange Responder is the address identifier of the target NVMe_Port.

TYPE: The value in the TYPE field shall be set to:

- a) 08h (i.e., Fibre Channel Protocol) (see FC-FS-5) for all frames of NVMe over FC Exchanges using IUs specified in table 32 and table 33; or
- b) (i.e., NVMe over Fibre Channel) (b) e FC-FS-5) all other frames.

6 NVMe over FC Link Services

6.1 Overview of Link Service requirements

The NVMe over FC link-legiprotocol includes the Basic Link Services (see FC-FS-5) and Extended rvices (see FC-LS The protocol also includes the LI ELS and PRLO ELS specified in and the PRLI NVMe over FC Service Parameter pages specified in 6.3.

Link-level protocols are used to configure the FC environment, including the establishment of figuration information and address information. NVMe over FC devices introduced into a figuration or modifications in the addressing or routing of the configuration may require the login discovery procedures performed again.

Overview of Process Login and Process Logout

The PRLI ELS is used to exchange Process Login service parameters between NVMe_Port and a target NVMe_Port, and is not used to establish logical image pair.

plicit login may be established by configuration conventions outside the scope of this standard, Process Login is optional except in the case where an initiator NVMe_Port is not using implicit login and is operating in a point-to-point topology. In this case, the initiator NVMe_Port shall always transmit an explicit PRLI ELS.

TE 2 — The requirement to transmit a PRLI ELS for an initiator NVMe_Port that is not using implicit login and operating in a point-to-point topology is to remove a deadlock condition that occurs when the target NVMe_Port N_Port_Name is larger than the initiator NVMe_Port N_Port_Name. In this case the target NVMe_Port PLOGI ELS request is processed, but the target NVMe_Port is prohibited from transmitting a PRLI ELS. If the initiator NVMe_Port does not transmit a PRLI ELS, then a deadlock occurs

LI ELS requests shall only be initiated by devices having the initiator N Port capability.

Devices having only target NVMe_Port capability shall not perform a PRLI ELS request.

initiator NVMe_Port shall have successfully completed Process Login with a target NVMe_Port ore NVMe over FC IUs are exchanged. An implicit Process Login may be performed by methods outside the scope of this standard. Any NVMe over FC IUs received by a target NVMe_Port from an Nx_Port that has not successfully completed Process Login with that target NVMe_Port shall be discarded. In addition, a target NVMe_Port that receives an NVMe_CMND IU from an Nx_Port that it has successfully completed PLOGI ELS with, but has not successfully completed Process in with that target NVMe_Port, shall discard the NVMe_CMND IU and respond with an explicit PRLO ELS (see 6.4).

The FC-4 Service Parameter pages for the NVMe over FC protocol are defined in 6.3.3 and 6.3.4.

Processing of a PRLI ELS or PRLO ELS request performs the clearing actions defined in table 3 and table 4.

6.3 PRLIELS

6.3.1 Use of PRLIELS

The PRLI ELS request is transmitted from an initiator NVMe_Port to a target NVMe_Port to exchange Process Login service parameters (see FC-LS-3).

rocess Login is successfully completed only if the NVMe over FC devices have complementary initiator NVMe_Port and target NVMe_Port capabilities. Some capabilities require support by both the initiator NVMe_Port and target NVMe_Port before they may be used 6.3.3.

An accept response code indicating other than 'Request executed' (see 6.3.4 and FC-LS-3) shall be provided if the PRLI ELS NVMe over FC Service Parameter page is incorrect.

A Link Service Reject (LS_RJT) indicates that the PRLI ELS request is not supported or is incorrectly formatted.

The PRLI ELS common service parameters and accept response codes are defined in FC-LS-3.

6.3.2 w or repeated Process Login

After the completion of any vor repeated Process Login, all clearing actions specified in table 3 and table 4 shall be performed.

6.3.3 PRLI ELS request NVMe over FC Service Parameter page format

The NVMe over FC Service Parameter page for the PRLI ELS request is specified in table 6.

Table 6 – PRLI ELS request NVMe over FC Service Parameter page

Bits Word	31 24	23 16	15	08	8	07		00
0	TYPE Code	Common Information						
1	Reserved							
2	Reserved							
3	Service Parameter Information							
4	Reserved							

TYPE Code: Shall be set to 28h to indicate this Service Parameter page is defined for NVMe over Fibre Channel (see FC-FS-5).

TYPE Code Extension: Shall be set to 00h.

Common Information: The format of the Common Information field is specified in table 7.

Table 7 - Common Information field format

Bit	Description
15	Reserved
14	Reserved
13	Establish Image Pair: Shall be set to zero.
12 to 0	Reserved

rvice Parameter Information: The format of the Service Parameter Information field is specified in table 8.

ple 8 – Service Parameter Information field format - request and accept

Bit	Description
31 to 8	Reserved
7	Confirmed Completion Supported: If set to one, then confirmed completion is supported (see 4.10). If set to zero, then confirmed completion is not supported.
6	Reserved
5	ator Function: If the Initiator Function bit is set to one, then the Originator or Responder is indicating it has the capability of operating as an initiator NVMe_Port. If the Initiator Function bit is set to zero, then the Originator or Responder does not have the capability of operating as an initiator NVMe_Port.
4	Target Function: If the Target Function bit is set to one, then the Originator or Responder is indicating that it has the capability of operating as a target NVMe_Port. If the Target Function bit is set to zero, then the Originator or Responder does not have the capability of operating as a target NVMe_Port. In the Initiator Function bit and the Target Function bit may be set to one. If the Initiator Function bit nor the Target Function bit is set to one, then the service parameters for the NVMe over FC Service Parameter page are under to be invalid. A Responder receiving such an invalid NVMe over FC Service Parameter page shall notify the Originator with a PRLI ELS accept response code of 'Service Parameters are invalid'. An Originator receiving such an invalid NVMe over FC Service Parameter page shall not perform NVMe over FC protocol operations with the Responder.
3	covery Service: If the Discovery Service bit is set to one, then the Originator Responder is indicating that it has the capability of operating as a Discovery Service as specified in NVMe over Fabrics. If the Discovery Service bit is set to zero, then the ginater or Responder does not have the capability of operating as a Discovery Service.
2 to 1	Reserved
0	First Burst Supported: If set to one, then first burst is supported clause 4.3). If set to zero, then first burst is not supported.

6.3.4 PRLI ELS accept NVMe over FC Service Parameter page format

The NVMe over FC Service Parameter page for the PRLI ELS accept is shown in table 9.

Table 9 – PRLI ELS accept NVMe over FC Service Parameter page

Bits Word	31 24	23 16	15 08 07 00					
0	TYPE Code	TYPE Code Extension	Common Information					
1		Reserved						
2		Reserved						
3	Service Parameter Information							
4	Rese	erved	First Burst Size					

(see table 6) exceptions, the service parameter definitions are identical feather PRLI ELS request

Common Information: The format of the Common Information field is specified in table 10.

Table 10 – Common Information field format

Bit	Description
15	Reserved
14	Reserved
13	Establish Image Pair: Shall be set to zero.
12	Reserved
11 to 8	Response Code: The Response Code field is defined in FC-LS-3.
7 to 0	Reserved

Service Parameter Information: The format of the Service Parameter Information field is specified in table 8.

First Burst Size: If first burst is not supported (see table 8), then the First Burst Size field normal procedures and supported (see table 8).

If the First Burst Size field is set to zero, then there is no first burst size limit.

If the First Burst Size field is not set to zero and first burst is supported, then the First Burst Size field indicates the maximum number of bytes that shall be transmitted in the first NVMe_DATA IU sent from the initiator NVMe_Port to the target NVMe_Port.

The First Burst Size field value is expressed in remember of 512 bytes (i.e., a value of one means bytes, two means 1024 bytes).

| Specific remembers of 512 bytes (i.e., a value of one means bytes, two means 1024 bytes).

| Specific remembers of 512 bytes (i.e., a value of one means bytes).

्रि data transmissions from the target NVMe_Port to the initiator NVMe_Port, the First Burst Size

6.4 PRLO ELS

The format for the PRLO ELS request and PRLO ELS accept is specified in FC-LS-3.

PRLO ELS request is transmitted from an pinator NVMe_Port to a Responder NVMe_Port to request that a Process Logout be performed. In the Process Logout completes successfully, then all clearing actions specified in 4.13 shall be performed.

PRLO ELS accept shall present a response NVMe over FC Service Parameter page for the uest NVMe over FC Service Parameter page. It is not an error to perform Process Logout for a process Login that does not exist.

A Link Service Reject (LS_RJT) indicates that the PRLO ELS request is invalid and not accepted.

After Process Logout, no further NVMe over FC communication is possible between those Nx_Ports.

The PRLO ELS accept response codes are defined in FC-LS-3.

7 FC-4 Name Server registration and objects

7.1 Overview of FC-4 specific objects for NVMe over FC

The Name Server for a Fibre Channel Fabric is specified in FC-GS-8. NVMe over FC specific objects are specified in this clause for use by the Name Server. FC-GS-8 provides complete descriptions of the operations that are performed to register objects with a Name Server and to query the Name Server for the value of the objects.

7.2 FC-4 TYPEs object

The FC-4 TYPEs object (see FC-GS-8) indicates a set of supported data structure type values for Device_Data and FC-4 Link_Data frames (see FC-FS-5).

An NVMe_Port shall register the NVMe over Fibre Channel PE (28h) with the Name Server using the RFT_ID request CT_IU. This registration shall precede registration of the FC-4 TYPE 28h FC-4 Features object.

7.3 FC-4 Features object

The FC-4 Features object (see FC-GS-8) defines a 4-bit field for each FC-4 TYPE code. The FC-4 Features object is a 32-word array of 4-bit values. The 4-bit FC-4 Features bits for NVMe over Fibre Channel TYPE 28h are inserted in bits 3 to 0 of word 5. The format of the 4-bit FC-4 Features bits for NVMe over Fibre Channel TYPE 28h is shown in table 11.

Table 11 - FC-4 Features bits for NVMe over FC

	Description
3	Reserved
2	Discovery Service (see NVM Express over Fabrics) supported. If the Discovery Service bit is set to one, then the NVMe_Port is indicating that it the capability of operating as a Discovery Service as specified in NVMe over Fabrics. If the Discovery Service bit is set to zero, then the NVMe_Port does not have the capability of operating as a Discovery Service as specified in NVMe over Fabrics.
1	NVMe over FC initiator function supported. If the NVMe over FC initiator function bit is set to one, then the NVMe_Port is indicating that it has the capability of operating as an NVMe over FC initiator. If the NVMe over FC initiator function bit is set to zero, then the NVMe_Port does not have the capability of operating as an NVMe over FC initiator.
0	NVMe over FC target function supported. If the NVMe over FC target function bit is set to one, then the NVMe_Port is indicating that it has the capability of operating as an NVMe over FC target. If the NVMe over FC target function bit is set to zero, then the NVMe_Port does not have the capability of operating as an NVMe over FC target.

8 NVMe FC-4 Link Services

8.1 Overview

FC-4 Link Service functionality is specified in FC-LS-3. For NVMe FC-4 Link Services, the Frame_Header fields (see 5) shall be set as follows:

- a) R_CTL Routing field (word 0, bits 31-28) shall be set to 0011b (i.e., an FC-4 Link_Data frame);
- b) the TYPE field shall be set to 28h (i.e., FC-NVMe FC-4 Link Service frame); and
- c) the R_CTL Information field (word 0, bits 27-24) shall be set to 0010b (i.e., unsolicited control) for request Sequences and 0011b (i.e., solicited control) for response Sequences.

The NVMe_LS requests and responses are specified in table 12.

Table 12 - NVMe LS requests and responses

Value (Bits 31-24)	Description	<mark>@</mark> br.	Reference
01h	NVMe_LS reject	NVMe_RJT	8.3
02h	NVMe_LS accept	NVMe_ACC	8.4
03h	Create Association	CASS	8.5

2	MSB				_									
3				Association Identifier LSB										

Descriptor length: The Descriptor length field contains the length in bytes of the wing payload.

Association Ident r: contains a value that identifies the NVMe over Fabrics vociation (see

8.3 NVMe_LS reject (NVMe_RJT)

NVMe_RJT notifies the originator of an NVMe_LS request that the NVMe_LS request Sequence has been rejected. An NVMe_RJT may be a response Sequence to any NVMe_LS request.

Addressing: The D_ID field specifies the source of the NVMe_LS request being rejected. The S_ID field specifies the destination of the NVMe_LS request being rejected.

The format of the NVMe_RJT payload is specified in table 24.

Table 24 – NVMe reject payload

Link Service Request Information descriptor: contains a Link Service Request Information descriptor (see 8.2.2).

9 NVMe over FC Information Unit (IU) usage and formats

9.1 Overview

Each NVMe over FC IU shall be contained in a single Sequence. Each Sequence carrying an NVMe IU shall contain only one IU.

NVMe over FC IUs and their characteristics are specified in table 32 for IUs sent to target NVMe_Ports.

Table 32 - NVMe over FC Information Units (IUs) sent to target NVMe_Ports

		Da	ata block			
IU	Description	R_CTL field	Content	F/M/L	SI	M/O
T1	Command request	06h	NVMe_CMND	F	Т	М
T2	Command request	06h	NVMe_CMND	F	Н	0
Т3	Data-Out action	01h	NVMe_DATA	М	Т	М
T4	Confirm	03h	NVMe_CONF	L	Т	0

Notes:

T2 is only permitted while NVMe_XFER_RDY IUs are disabled.

T2 allows optional Sequence streaming during write operations.

T4 is only permitted in response to an I4 or I6 frame (see table 33).

Kev:

9.2 NVMe CMND IU format

The NVMe_CMND IU contains an NVM command request and associated information. If an invalid combination of bits is set in the NVMe_CMND IU, then the target NVMe_Port shall respond with an NVMe_ERSP IU with the Status Code field set to INVALID FIELT table 41). The format of the NVMe_CMND IU is specified in table 34.

Table 34 - NVMe_CMND IU format

Bit Word	3		2 9				2 5		2		2	2	1 9	1 8	1 7	1 6	1 5	1 4	1	1 2	1	1 0	9	8	7	6	5	4	3	2	1	0

22															R	ese	erve	ed														
23															R	ese	erve	ed														

SI ID: The SCSI ID field shall be set to FDh (see SAM-6).

FC ID: The FC ID field shall be set 88h to indicate FC-NVMe FC-4 Type.

CMND IU Length: The CMND IU Length field specifies the length in 4-byte words of the NVMe_CMND IU.

Flags: The Flags field bits are specified in table 35.

Table 35 - Flags field descriptors

Bit	Description
0	te
1	Read
2 to 7	Reserved

If the Write bit is set to one, then the initiator NVMe_Port expects to transmit NVMe_DATA IUs to the target NVMe_Port (i.e., a write operation).

If the Read bit is set to one, then the initiator NVMe_Port expects to receive NVMe_DATA IUs from the target NVMe_Port (i.e., a read operation).

If the Read bit and Write bit are both set to zero, then there shall be no NVMe_DATA IUs and the Data Length field shall be set to zero.

A target NVMe_Port shall return an NVMe_ERSP IU with the Status Code field set to 01h (i.e., INVALID FIELD) if the following protocol errors are detected:

- a) a read operation has the Read bit set to zero or the Write bit set to one;
- b) a write operation has the Write bit set to zero or the Read bit set to one;
- c) the Read bit and Write bit are both set to one; or
- d) the Read bit and Write bit are both set to zero and the Data Length field value is not zero.

Me Connection Identifier: The NVM ponnection Identifier field identifies the unique FC session ociating a host with a subsystem NQ

Command Sequence Number (CSN): The Command Sequence Number field enables the receiving NVMe_Port to maintain proper command ordering as specified in 4.7.2.

Data Length: The Data Length field indicates the length of the data to be read or written for the command.

For a read command, the Data Length field contains a count of the maximum number of all bytes to be transferred from the target NVMe_Port in NVMe_DATA IU payloads by the command.

For a write command, the Data Length field contains a count of the maximum number of all bytes to be transferred to the Target NVMe_Port in NVMe_DATA IU payloads by the command.

A Data Length field value of zero indicates that no data transfer is expected regardless of the state of the R and VIII and that no NVMe_XFER_RDY or NVMe_DATA IUs shall be transferred.

NVM Submission Queue Entry: The NVM Submission Queue Entry is specified in NVMe over Fabrics revision 1.0.

9.3 NVMe_XFER_RDY IU format

The format of the NVMe XFER RDY IU is specified in table 36.

Table 36 - NVMe XFER RDY IU format

Bit	3	3	2	2	2	2	2	2	2	2	2	2	1	1	1	1	1	1	1	1	1	1										
Word	1	0	9	8	7	6	5	4	3	2	1	0	9	8	7	6	5	4	3	2	1	0	9	8	7	6	5	4	3	2	1	0
0														R	ela	tive	∍ C)ffs	et													
1														E	3ur	st l	_er	ngth	า													
2															Re	ese	erve	ed														

Relative Offset: The Relative Offset field contains a value specifying the relative offset in the Parameter field for the first data byte of the requested NVMe_DATA IU.

The Relative Offset field shall have a value that is a multiple of 4 (i.e., each NVMe_DATA IU shall begin on a word boundary).

Burst Length: The Burst Length field contains a value indicating the amount of buffer space prepared for all bytes to be transferred in the next NVMe_DATA IU and requests the transfer of an NVMe_DATA IU of that length from the initiator NVMe_Port.

The sum of the value of the Burst Length field and the value of the Relative Offset field shall not exceed the value of the Data Length field. The value in the Burst Length field shall not be zero.

9.4 NVMe_DATA IU format

9.4.1 Me_DATA IU overview

The data associated with a particular NVMe over FC I/O operation is transmitted in the same Exchange that sent the NVMe_CMND IU requesting the transfer.

NVMe over FC data transfers may be performed by one or more data delivery requests with the following constraints:

- a) (if the First Burst Supported bit is set to one), the first burst NVMe_DATA IU shall be no longer than the First Burst Size field value (see 6.3.4);
- b) NVMe_DATA IUs for write data, excluding the first burst NVMe_DATA IU, shall be the length specified in the Burst Length field value in the corresponding NVMe_XFER_RDY IU that was received; and
- c) (NVMe_DATA IUs for read data) shall be no longer than the Data Length field in the received NVMe_CMND IU.

If more than one NVMe_DATA IU is used to transfer the data, the relative offset value in the Parameter field is used to ensure that the NVM data is reassembled in the proper order.

If the NVMe_DATA IU is for first burst write data, then the relative offset for the NVMe_DATA IU shall be set to zero. If the first frame transmitted of the first burst NVMe_DATA IU has a relative offset that is not zero, then the target NVMe_Port shall return an NVMe_ERSP IU with the Status Field of the NVMe CQE set to TRANSPORT ERROR (see table 41).

If an NVMe_XFER_RDY IU is used to describe a data transfer and the first frame transmitted of the requested NVMe_DATA IU has a relative offset that differs from the value in the Relative Offset field of the NVMe_XFER_RDY IU, then the target NVMe_Port shall return an NVMe_ERSP IU with the Status Field of the NVMe CQE set to TRANSPORT ERROR (see table 41).

All write data NVMe_DATA IUs excluding the first burst NVMe_DATA IU if applicable, shall be preceded by an NVMe_XFER_RDY IU containing a standard data descriptor payload that indicates the location and length of the data delivery. If the First Burst Supported bit is set to one in the NVMe over FC Service Parameter page request and accept (see 6.3), then the first NVMe_DATA IU may be transmitted without a preceding NVMe_XFER_RDY IU.

If more than one read data NVMe_DATA IU is used to transfer the data, the relative offset of the NVMe_DATA IU may be specified in any order (i.e., there is no requirement that successive read data NVMe_DATA IUs specify increasing and successive relative offsets).

If more than one ME_XFER_RDY is used to transfer write data, the relative set of the NVMe_XFER_RDY may be specified in any order (i.e., there is no requirement that successive NVMe_XFER_RDY IUs specify increasing and successive relative offsets). Data overlay is not allowed except to retransmit first burst write data.

If error conditions occur that prevent the transfer of data in the middle of a NVMe_DATA IU) then the target NVMe_Port NVMe_ERSP IU Transferred Data Length field (see table 38) shall indicate a value that reflects the amount of data transferred up until the point of the error, and the target NVMe_Ports all set the NVMe CQE Status propriate value to reflect the error.

9.4.2 NVMe DATA IUs for read and write operations

During any data transfer, the initiator NVMe_Port shall have available a buffer of the length specified by the Data Length field in the NVMe_CMND IU. The buffer contains data to be transferred to the target NVMe_Port if the operation is a write operation (i.e., an operation that uses the Data-Out action, IU Tipe he target NVMe_Port shall not request or deliver data outside the buffer length defined by the Data Length field value.

If the command requested that data beyond the length specified by the Data Length field be transferred, then the target NVMe_Port shall:

- a) transfer no data and return NVMe_ERSP IU with the Transferred Data Length set to zero and the Status Field of the NVMe CQE set to 04h (i.e., Data Transfer Error); or
- b) may transfer data and return NVMe_ERSP IU with the Transferred Data Length set to amount of data transferred and Status Field of the NVMe CQE set to 04h (i.e., Data Transfer Error).

During a write operation that is sending first burst data, the initiator NVMe_Port indicates that it has transferred all the first burst data by transferring Sequence Initiative to the target NVMe_Port.

The initiator NVMe_Port shall not transfer data outside the buffer length defined by the Data Length field value. If the initiator NVMe_Port transfers an amount of first burst data that exceeds the Data Length in the NVMe_CMND IU then the target NVMe_Port shall discard the excess bytes. The target NVMe_Port shall then return an NVMe_ERSP IU with the Transferred Data Length set to the number of bytes received and not discarded, and the Status Field of the NVMe CQE set to 04h (i.e., Data Transfer Error).

Upon completion of all data transfer for the command as determined by the target Me_Port the Transferred Data Length field value in the NVMe_ERSP IU shall be set to the number of bytes transferred, as adjusted by first burst retransmission, if applicable.

9.4.3 NVMe_Port transfer byte counting

- a) maintain a byte count of transferred data for the command;
- b) the byte count shall be set to zer on transmitting the NVMe_CMND IU;
- c) each successfully received NVMe_DATA IU;
- d) when transferring write data the byte count shall be incremented the amount of payload in each successfully transmitted NVMe_DATA IU;
- e) rest burst was transmitted for the command and a NVMe_XFER_RDY IU is received with relative offset set to zero, then byte count shall be decremented by the amount of first burst data transmitted; and
- if an NVMe_ERSP IU is received with a Transferred Data Length field value that does match its transferred byte count and the NVMe CQE Status Field set to zero (i.e., Successful Completion) or the initiator NVMe_Port receives an NVMe_RSP IU and its transferred byte count does not match the Data Length field value in the NVMe_CMND IU, the initiator NVMe_Port shall interact with the Me implementation to the NVMe_CMND IU.

a) maintain a byte count of transferred data for the command;

- b) the byte count shall be set to zero upon receiving the NVMe CMND IU;
- c) when transmitting read data the byte count shall be incremented by the amount of payload in each successfully transmitted NVMe_DATA IU;
- d) when receiving write data the byte count shall be incremented by the amount of payload in each successfully received NVMe_DATA IU;
- e) if first burst was received and discarded the byte count shall remain zero;
- f) an NVMe_RSP IU shall only be sent if the byte count is equal to the length value specified in the NVMe CMND IU; and
- g) when sending an NVMe_ERSP IU the Transferred Data Length field shall be set to the byte count.

NVMe_DATA IU use of fill bytes

During transfer of data in response to an NVMe_CMND_IU with the Read bit set to one and the Write bit set to zero, all frames of NVMe_DATA_IUs except the frame with the highest relative offset within the Data-In Buffer shall have no pytes.

During transfer of data in response to an NVMe_CMND_IU with the Write bit set to one and the Read bit set to zero, all frames of NVMe_DATA_IUs except the frame with the highest relative offset within the Data-Out Buffer shall have no fill bytes.

NVMe_RSP IU format

The format of the NVMe_RSP IU is specified in table 37. The NVMe_RSP IU may be used for Completion Queue Entries containing Status Code Type field set to 0h (i.e., Generic Command Status) (see NVM Express revision 1.2.1) and Status Code field set to 00h (i.e., Successful Completion) (see NVM Express revision 1.2.1);

Table 37 - NVMe_RSP IU format

Bit	3	3	2	2	2	2	2	2	2	2	2	2	1	1	1	1	1	1	1	1	1	1

Status Code: the Status Code field contains an NVMe over FC specific status value specified in table 39.

Table 39 - Status Code field values

Value	Name	Description
00h	SUCCESS	No status.
01h	INVALID FIELD	NVMe_CMND IU field is invalid.
02h	INVALID CONNECTION ID	Connection Identifier is invalid.
Others	-	Reserved

ERSP IU Length: The ERSP IU Length field specifies the length in 4-byte words of the NVMe_ERSP IU.

Response Sequence Number: The Response Sequence Number field enables the receiving NVMe_Port to maintain proper response ordering as specified in 4.7.3.

msferred Data Length: Specifies the total number of bytes transferred in Data (read) or Data (write) IUs on behalf of the command. This field shall be set to zero if no data has been transferred for the command.

NVM Completion Queue Entry: The NVM Completion Queue Entry field contains an NVM Completion Queue Entry specified in NVMe over Fabrics revision 1.0.

9.7 NVMe_CONF IU format

The NVMe_CONF IU has no payload. It is used as specified in 4.10 for an initiator NVMe_Port to confirm the receipt of an NVMe_RSP IU or NVMe_ERSP IU from a target NVMe_Port. The frame

Ill be transmitted by an initiator NVMe_Port if the confirmed completion protocol is supported by both the target NVMe_Port and the initiator NVMe_Port confirmation has been requested by the target NVMe_Port.

10 NVMe over Fabrics

10.1 Discovery

10.1.1 Overview

A target NVMe_Port that participates in FC-NVMe Fabric discovery shall support an NVMe Discovery Service (see NVMe over Fabrics revision 1.0) that reports NVM subsystems local to the target NVMe_Port.

NOTE 3 – In a Fabric topology, discovery of NVM subsystems behind target NVMe_Ports that do not support an NVMe Discovery Service is outside the scope of this standard.

10.1.2 Discovery Log Page Entry

The Discovery Log Page for NVMe over FC is specified in table 40.

Table 40 – Discovery Log Page for NVMe over FC

Bit			2	2	2	2	2	2	2	2	2	2	1	1	1	1	1	1	1	1	1	1			_	_	_	,	•	0	,

400	_	(256 bytes)																														
192		Transport Specific Address Subtype																														
255	(TSAS) (256 bytes)																															

Transport Type: | Il be set to 02h (see NVMe over Fabrics revision 1.0).

Address Family: be set to 04h (see NVMe over Fabrics revision 1.0).

N Type: shall be set to 01h (i.e., referral) or 02h (i.e., NVM subsystem) (see NVMe over Fabrics Tevision 1.0).

Transport Requirements: see NVMe over Fabrics revision 1.0.

Port ID: shall be set to an NVM subsystem specific value (see NVMe over Fabrics revision 1.0).

Controller ID: shall be set to an NVM subsystem specific (see NVMe over Fabrics revision 1.0).

Admin Max SQ Size: shall be set to an NVM subsystem specific value (see NVMe over Fabrics revision 1.0).

Transport Service ID: shall be set to ne" (see NVMe over Fabrics revision 1.0).

NVMe Qualified Name: shall be set to the subsystem NQN (see NVMe over Fabrics revision 1.0).

Transport Address: shall be set to "nn-WWNN:pn-WWPN" where:

- a) WWNN is the rid Wide Node Name of the target NVMe_Port; and
- b) WWPN is the rid Wide Port Name of the target NVMe_Port.

The WWNN and WWPN are the SII values of the rIdwide_Name(s).

Transport Specific Address Subtype: shall be set to all zeroes.

The value range B0-BFh defined by NVMe Express (see NVMe over Fabrics revision 1.0) for transport specific errors.

Transport specific status values for NVMe over FC are specified in table 41.

Table 41 – NVMe over FC transport specific status values

Value	Name	Description
B0h	TRANSPORT ERROR	Generic failure
B1h	TRANSPORT ABORTED	I/O failure due to ABTS-LS
B2h to BFh	Reserved	

11 Link error detection and error recovery procedures

11.1 Overview

This standard provides several mechanisms for NVMe over FC devices to identify protocol errors caused by frames and responses that have been corrupted and discarded in accordance with the requirements of FC-FS-5. See 11.2 for a list of these mechanisms.

11.2 or detection

An initiator NVMe_Port shall detect the following:

- a) a Sequence error (see FC-FS-5) in a Sequence transmitted from a target NVMe_Port to an initiator NVMe_Port;
- b) an Me_XFER_RDY IU seceived on an Exchange where the NVMe_CMND IU flags had the read bit set to one.
- c) a command ompleted with an NVMe_ERSP IU and the initiator data transfer byte count value is not equal to the NVMe_ERSP IU Transferred Data Length field value; and
- d) a command is completed with an NVMe_RSP IU and the initiator data transfer byte count value is not equal to the NVMe_CMND IU Data Length field value.

A target NVMe_Port shall detect the following:

- a) a Sequence error (see FC-FS-5) in a Sequence transmitted from an initiator NVMe_Port to a target NVMe_Port; and
- b) an NVMe_DATA IU is received with a starting Relative Offset value that is not set to the same Relative Offset value contained in the last NVMe_XFER_RDY IU transmitted to the initiator.

Upon detection of an error, the detecting NVMe_Port may transmit an ABTS-LS to terminate the ing Exchange and recover the associated Exchange resources (see 11.3). If an NVMe I/O Exchange is terminated by an ABTS-LS, as it potentially causes loss of a SQE, CQE or data for an NVMe nmand. For ABTS-LS shall cause the termination of the NVMe over FC connection and NVMe over FC association that were associated with NVME I/O Exchange

11.3 hange level recovery using ABTS-LS

11.3.1 ABTS-LS overview

ABTS-LS is an FC-FS-5 protocol that recovers NVMe_Port resources associated with an Exchange that is being terminated because of an error NVMe I/O Exchange is terminated by an ABTS-LS, as it potentially causes loss of a SQE, CQE or data for an NVMe command the termination of the NVMe over FC connection and NVMe over FC association that re associated with NVMe I/O Exchange. Refer to the actions specified in clause 4 for termination of FC-NVMe transport connections and ociations.

All NVMe over FC compliant initiator and target NVMe_Ports shall be capable of transmitting an Abort Exchange (i.e., ABTS-LS), and capable of accepting and processing an ABTS-LS.

11.3.2 Initiating NVMe_Port Exchange termination

The NVMe_Port terminating the Exchange is an ABTS-LS to the D_ID of the corresponding NVMe_Port of the Exchange being terminated. The ABTS-LS shall be generated using the OX_ID field and RX_ID field values of the Exchange be aborted. FC-FS-5 allows ABTS-LS to be transmitted by an NVMe_Port regardless of whether or not it has Sequence Initiative. Following the

transmission of ABTS-LS, any Device_Data Frames received for the Exchange being terminated shall be discarded until the BA_ACC with the F_CTL field Last_Sequence bit set to one (i.e., last Sequence of the Exchange) is received from the corresponding NVMe Port.

change termination may not take effect immediately (e.g., if ABTS-LS is sent following transmission of a read command, an NVMe_Port may receive some or all of the requested read data before receiving the BA_ACC for the ABTS-LS). The NVMe_Port shall be capable of receiving this data and providing BB_Credit in order for the corresponding NVMe_Port to transmit the BA_ACC.

If a BA_ACC, BA_RJT, LOGO ELS, or PRLO ELS is not received from the corresponding NVMe_Port within two times R_A_TOV, then second level error recovery (see 11.4) shall be performed.

11.3.3 Recipient NVMe_Port response to Exchange termination

If an ABTS-LS is received by an NVMe_Port, it shall the designated Exchange and return one of the following responses:

- the receiving NVMe_Port shall discard the ABTS-LS and transmit a LOGO ELS if the Nx_Port issuing the ABTS-LS is not currently logged in (i.e., no N_Port Login exists);
- b) the receiving NVMe_Port shall return BA_RJT with the F_CTL field Last_Sequence bit set to one (i.e., last Sequence of the Exchange) if the received ABTS-LS contains an assigned RX_ID field value and a FQXID that is unknown to the receiving NVMe_Port; or
- the receiving NVMe_Port shall return BA_ACC with the F_CTL field Last_Sequence bit set to one (i.e., last Sequence of the Exchange).

Upon transmission of any of the above responses, the receiving NVMe_Port may reclaim any resources associated with the designated Exchange after R_A_TOV has elapsed.

If the RX_ID field is set to FFFFh, receiving NVMe_Ports shall qualify the FQXID of the ABTS-LS based only upon the combined values of the D_ID field, S_ID field, and the OX_ID field, not the RX_ID field.

11.3.4 Error recovery

NVMe over Fabrics revision 1.0 specifies unrecoverable transport errors should result in termination of the NVMe transport connection, and association between the host and controller.

such, an initiator NVMe_Port or target NVMe_Port, after detecting an error in an Exchange, shall stop all processing of the Exchange and its associated NVMe command, and the detecting NVMe_Port shall issue an ABTS-LS for the Exchange 11.3).

11.3.5 Additional error recovery by initiator NVMe_Port

If an initiator NVMe_Port detects a Sequence error, it shall discard the Sequence(s) based on the Exchange error policy specified by the F_CTL field Abort Sequence Condition (see FC-FS-5) bits in the first frame of the Exchange.

The initiator NVMe_Port shall defer to upper level protocol mechanisms to determine lack of continued response by the target NVMe_Port for a particular Exchange and the error recovery actions that are to be taken in such situations. For example, the Me protocol layer may maintain an "io completion timer", that upon expiration, proceeds to send a nvMe Admin ORT command to terminate the corresponding NVMe command. The NVMe protocol layer may also detect a lack of completion for a command and revert to resets of the NVMe controller, which will terminate the FC-

NVMe association, its FC-NVMe connections, as well as all outstanding I/O operations on those nections. The I/O operations, which correspond to NVMe Exchanges, shall be terminated by initiator NVMe_Port ABTS-LS.

11.3.6 Additional error recovery by target NVMe_Port

If a target NVMe_Port detects a Sequence error, it shall discard the Sequence(s) based on the Exchange error policy specified by the F_CTL field Abort Sequence Condition (see FC-FS-5) bits in the first frame of the Exchange.

The target NVMe_Port shall not attempt recovery for Sequence errors. The target NVMe_Port shall depend on the initiator NVMe_Port for recovery.

Target NVMe_Ports shall implement IR_TOV (see 12.3) to facilitate recovery of resources allocated to an initiator NVMe_Port that is no longer responding. The target NVMe_Port may transmit a LOGO ELS to the initiator NVMe_Port and terminate all NVMe over FC associations, all NVMe over FC nections, and all open Exchanges for that initiator NVMe_Port upon IR_TOV timeout without the numerator NVMe_Port transmitting any expected Sequence for any open Exchange at this target NVMe_Port (e.g., NVMe over FC write Data-In response to an NVMe_XFER_RDY IU).

11.4 Second-level error recovery

11.4.1 **ABTS** error recovery

If a response to an TS is not received within two times R_A_TOV, then the NVMe_Port may transmit the TS again, attempt other retry operations allowed by FC-FS-5, or explicitly logout the corresponding NVMe_Port. If those retry operations attempted are unsuccessful, then the NVMe_Port shall explicitly logout (i.e., transmit a LOGO ELS) the corresponding NVMe_Port. All outstanding Exchanges as well as all NVMe over FC connections and NVMe over FC associations, with the corresponding NVMe_Port are terminated at the NVMe_Port.

11.5 Responses to frames before port login or process login

If a target NVMe_Port receives an NVMe FC-4 Link Service or NVMe_CMND IU from an NVMe_Port that is not successfully logged into the target NVMe_Port using either an implicit or explicit login, then it shall discard the Link Service or NVMe_CMND IU and, in a new Exchange, transmit a LOGO ELS request to that NVMe_Port. No Exchange is created in the target NVMe_Port for the discarded request, and the Originator of the discarded request ninates the Exchange associated with the discarded request and any other open Exchanges for the target NVMe_Port transmitting the LOGO ELS.

If a target NVMe_Port receives an NVMe FC-4 Link Service or NVMe ND IU from an NVMe_Port that has not successfully completed either implicit or explicit Process Login with the target NVMe_Port, then it shall discard the Link Service or NVMe_CMND IU and transmit a PRLO ELS to the initiator NVMe_Port. No Exchange is created in the recipient NVMe_Port for the discarded request, and the Originator of the discarded request the Exchange associated with the discarded request.

If an NVMe over FC device receives a frame of category 0001b or 0011b (i.e., solicited data or solicited control) and the NVMe over FC device has not performed successful implicit or explicit login and Process Login with the source of the frame, then the NVMe over FC device shall discard and ignore the content of the frame. If login is not completed, then the NVMe over FC device may transmit a LOGO ELS request to the source of the unexpected frame. If login is completed, but Process Login

is not completed, then the NVMe over FC device may transmit a PRLO ELS request to the source of the unexpected frame.

12 Timers for operation and recovery

12.1 Overview

This clause indicates the use of timers defined by other standards in performing the NVMe recovery procedures. In addition, the clause defines those timers used only by this standard.

Table 42 - Timers summary

	Impleme	entation		Default				
Timer	Initiator NVMe_Port	Target NVMe_Port	Description	Value				
R_A_TOV	М	М	Resource_Allocation_Timeout Value	see FC-FS-5	12.2			
IR_TOV		M	Initiator Response Timeout Value	2 s ^a	12.3			

12.2 Resource Allocation Timeout Value (R_A_TOV)

R_A_TOV is the minimum amount of time that a Sequence Initiator shall wait before reusing the Sequence_Qualifier associated with an aborted Sequence. The Sequence_Qualifier is composed of the S_ID field, D_ID field, OX_ID field, RX_ID field, and SEQ_ID field.

An NVMe_Port shall not wait R_A_TOV after receiving a BA_ACC to an ABTS-LS before reusing the Sequence_Qualifier.

Originator of an NVMe FC-4 Link Service Exchange shall detect an Exchange error following sequence Initiative transfer if the reply Sequence is not received within a timeout interval equal to twice the value of R_A_TOV.

12.3 Initiator Response Timeout Value (IR_TOV)

IR_TOV is the minimum time a target NVMe_Port shall wait for an initiator NVMe_Port response following transfer of Sequence Initiative from the target NVMe_Port to the initiator NVMe_Port (e.g., following transmission of the NVMe_XFER_RDY IU during a write command). If the initiator NVMe_Port does not send a response within IR_TOV of the transfer of Sequence Initiative, then a target NVMe_Port may send an ABTS-LS to terminate the Exchange.

Annex A (informative) NVMe Information Unit examples

A.1 Overview

The byte order of Fibre Channel standards is big-endian. such, multi-byte values are transmitted or stored in host memory with the Most Significant Byte (MSB) first. For example, when transmitting a four byte word, the Most Significant Byte (i.e., corresponding to bits 31:24) is placed first, followed by the next lesser significant byte (i.e., corresponding to bits 24:16), followed by the next lesser significant byte (i.e., corresponding to bits 15:8), followed by the Least Significant Byte (i.e., corresponding to bits 7:0).

In contrast, the byte order of the NVM Express and NVM Express over Fabrics specifications is little-endian. such, multi-byte values are transmitted or stored in host memory with the Least Significant Byte (LSB) first. For example, when transmitting a four byte word, the Least Significant Byte (i.e., corresponding to bits 7:0) is placed first, followed by the next more significant byte (i.e., corresponding to bits 15:8), followed by the next more significant byte (i.e., corresponding to bits 23:16), followed by the Most Significant Byte (i.e., corresponding to bits 31:24).

he FC-NVME standard, the NVMe_CMND IU and NVMe_ERSP IU are defined with Fibre Channel specific areas which then encapsulate the NVM Express specific area. When transmitting or storing the IU payload, the IU will be treated as paw bytestream and each area will be stored in its native endianness. The Fibre Channel area is ed in big-endian and the NVM Express area is stored in little-endian.

To further clarify, the following diagrams document the IU content with the NVM Express areas explicitly enumerated and converted to diagrams that are consistent with the Fibre Channel standard and viewed as big-endian in their entirety.

A.2 NVMe_CMND IU payload

Table A.1 illustrates a NVMe_CMND IU with the NVM Express SQE area explicitly converted to its representation in a payload that is big-endian in nature. The SQE follows the format for a NVM Command Set as defined in section 4.2 of the NVMe Express pecification. The SGL1 field,

contained in words 12-15, illustrates a SGL Data Block Descriptor. As a reminder, all multi-byte fields for the NVM Express area are stored LSB first (i.e., leftmost) proceeding to MSB last (i.e., rightmost).

Table A.1 - NVMe_CMND IU with NVM Express SQE format

Annex B (informative) NVMe over FC command IU examples

B.1 Overview

The steps given in the following examples indicate the normal exchange of NVMe over FC IUs corresponding to the handling of an NVMe command. The examples are not all inclusive. There may be additional transmissions to detect and recover from FC frame loss or error, or to communicate command response reception.

B.1.1 NVMe command with no payload

The following procedure illustrates the basic steps for an NVMe command which does not have payload. The command is initiated by an SQE and completed by a CQE.

- The initiator NVMe_Port allocates an Exchange and transmits a NVMe_CMND IU. The SQE
 within the IU contains the command. The IU indicates the association and connection of the
 command:
- The target NVMe_Port receives the IU and interacts with the NVMe layer to initiate processing of the command;
- 3) The NVMe layer finishes command processing, constructs a corresponding CQE, and posts it to the FC-NVMe layer; and
- 4) The target NVMe_Port transmits an NVMe_RSP IU or NVMe_ERSP IU to communicate the CQE contents relative to the Exchange/NVMe command back to the initiator NVMe_Port. The Exchange is completed.

B.1.2 NVMe command with read payload

The following procedure illustrates the basic steps for an operation where command data is passed from the target NVMe_Port to the initiator NVMe_Port (i.e., read operation). The command is initiated by an SQE and completed by a CQE. Data transfer for the command is initiated by the target NVMe_Port. The read data may be response data, on operations that are not LBA-relative, or LBA read data.

- The initiator NVMe_Port allocates an Exchange and transmits an NVMe_CMND IU. The SQE within the IU contains the command. The IU indicates the association and connection of the command:
- The target NVMe_Port receives the IU and interacts with the NVMe layer to initiate processing of the command;
- The NVMe layer makes one or more requests to transfer the read data to the initiator. For each request, the target NVMe_Port transmits an NVMe_DATA IU containing the provided read data;
- 4) The NVMe layer finishes command processing, constructs a corresponding CQE, and posts it to the FC-NVMe layer; and
- 5) The target NVMe_Port transmits an NVMe_RSP_IU or NVMe_ERSP_IU to communicate the CQE contents relative to the Exchange/NVMe command back to the initiator NVMe_Port. The Exchange is completed.

B.1.3 NVMe write command with no first burst

The following procedure illustrates the basic steps for an operation where command data is passed from the initiator NVMe_Port to the target NVMe_Port (i.e., write operation). The command is initiated by an SQE and completed by a CQE. Data transfer for the command is initiated by the target NVMe_Port. The write data may be command data operations that are not LBA-relative, or LBA write data.

- The initiator NVMe_Port allocates an Exchange and transmits a NVMe_CMND IU. The SQE within the IU contains the command. The IU indicates the association and connection of the command;
- 2) The target NVMe_Port software receives the IU and interacts with the NVMe software to initiate processing of the command;
- 3) The NVMe layer makes one or more requests to transfer the write data from the initiator NVMe_Port. For each request:
 - a) the target NVMe_Port transmits an NVMe_XFER_RDY IU indicating the desired data range; and
 - b) the initiator NVMe_Port transmits an NVMe_DATA IU containing the requested write data:
- 4) The NVMe layer finishes command processing, constructs a corresponding CQE, and posts it to the FC-NVMe layer; and
- 5) The target NVMe_Port transmits an NVMe_RSP_IU or NVMe_ERSP_IU to communicate the CQE contents relative to the Exchange/NVMe command back to the initiator NVMe_Port. The Exchange is completed.

B.1.4 NVMe write command with first burst

The following procedure illustrates the basic steps for an operation where command data is passed from the initiator NVMe_Port to the target NVMe_Port (i.e., write operation). In this example, an initial burst of data is transmitted to the target NVMe_Port along with the command. The command is initiated by an SQE and completed by a CQE. Data transfer for the command, except for the initial burst, is initiated by the target NVMe_Port. The write data may be command data, on operations that are not LBA-relative, or LBA Write data.

- The initiator NVMe_Port allocates an Exchange and transmits an NVMe_CMND IU. The NVMe_CMND IU does not pass Sequence Initiative. The SQE within the IU contains the command. The IU indicates the association and connection of the command;
- 2) The initiator NVMe_Port transmits an NVMe_DATA IU containing an initial burst of write data. The write data starts at offset 0. The length of the data is subject to the values the PRLI ELS;
- The target NVMe_Port software receives the NVMe_CMND IU and interacts with the NVMe layer to initiate processing of the command;
- The target NVMe_Port receives the NVMe_DATA IU and interacts with the NVMe layer for handling;
- 5) If additional write data is to transferred, the NVMe layer makes one or more requests to transfer the write data from the initiator NVMe_Port. For each request:
 - a) the target NVMe_Port transmits an NVMe_XFER_RDY IU indicating the desired data range; and
 - b) the initiator NVMe_Port transmits an NVMe_DATA IU containing the requested write data;

- 6) The NVMe layer finishes command processing, constructs a corresponding CQE, and posts it to the FC-NVMe layer; and
- 7) The target NVMe_Port transmits an NVMe_RSP_IU or NVMe_ERSP_IU to communicate the CQE contents relative to the Exchange/NVMe command back to the initiator. The Exchange is completed.

Annex C

(informative)

NVMe over FC initialization and device discovery

C.1 NVMe over FC device discovery procedure

C.1.1 Initiator discovery of switched Fabric-attached target NVMe_Ports

The following procedure may be used by initiator NVMe_Ports for discovering NVMe over FC devices in a switched Fabric topology.

Depending on the specific configuration and the management requirements, any step other than steps 1 through 3 may be omitted and may be performed using actions outside this standard or the referenced standards.

- 1) Perform Fabric Login;
- 2) Login with the Name Server;
- 3) Register information with Name Server:
 - a) FC-4 TYPEs object (see 7.2); and
 - b) FC-4 Features object (see 7.3).
- 4) Register for State Change Notification with the Fabric Controller (see FC-LS-3);
- 5) Issue a GID_FF (see FC-GS-8) query to the Name Server with the Domain_ID Scope and Area_ID Scope fields set to zero, the FC-4 Feature Bits field set to 04h (i.e., Discovery Service supported), and the Type code field set to 28h (i.e., NVMe over FC). This query obtains a list of the Port Identifiers (see FC-GS-8) of devices that support the NVMe over FC protocol, and a Discovery Service (see NVMe over Fabrics);
- 6) For each Port Identifier returned in the accept CT_IU for the GID_FF which returned all N_Port Id's with support for Type 0x28 and FC-4 Feature Bits 04h (i.e., NVMe Discovery Service supported):
 - i) the NVMe layer initiates a session with the NVMe Discovery Service:
 - the initiator NVMe_Port ensures there is a login with the FC target NVMe_Port. Note: if there is already an active login between the initiator NVMe_Port and target NVMe_Port's, these steps may be skipped:
 - i) send PLOGI:
 - ii) send PRLI with Type field set to 28h;
 - 2) FC-NVMe layer creates an association and the initial Admin Queue connection:
 - i) send Create Association NVMe_LS to the Discovery Service subsystem.
 - 3) the NVMe layer issues a Me Connect command via the newly created transport Admin Queue connection. The Connect command is to create the Admin Queue.
 - the Connect command is classified as a write operation (see B.1.3 or B.1.4).
 - 4) the NVMe layer may request further NVMe or Fabric commands to be processed via the transport Admin Queue connection. The additional commands may perform NVMe Fabrics authentication or may be NVMe or NVMe Fabric commands to get/set properties to configure the newly created NVMe controller instance created by the Admin Queue Connect command.
 - i) the commands are classified as no-data (see B.1.1), read (see B.1.2), or write (see B.1.3 or B.1.4) operations.
 - 5) as this is a NVMe Discovery Service, no IO queues are created.

- 6) the NVMe layer issues a Get Log Page command, with Log Identifier set to 70h, to read the Discovery Log Entries from the Discovery Service.
 - i) the command is classified as a read operation (see B.1.2).
- 7) the NVMe layer may determine that no further interaction with the Discovery Service is necessary and may use the FC-NVMe layer to terminate the service.
 - send NVMe_Disconnect LS to the Discovery Service. The LS parameters will indicate to terminate the association.
 - ii) the FC-NVMe target receives the LS and generates the LS response.
 - iii) the transport association and all connections for it are terminated.
 - iv) if this was the only association between the initiator NVMe_Port and target NVMe_Port, the login may be terminated:
 - send LOGO to the FC-NVMe target.
- 7) Issue a GID_FF (see FC-GS-8) query to the Name Server with the Domain_ID Scope and Area_ID Scope fields set to zero, the FC-4 Feature Bits field set to 01h (i.e., NVMe over FC target function supported), and the Type code field set to 28h (i.e., NVMe over FC). This query obtains a list of the Port Identifiers (see FC-GS-8) of devices that support the NVMe over FC protocol, and support the NVMe over Fabrics Target Port Function;
- 8) During operation, if the NVMe layer chooses to communicate with a NVMe (i.e., storage) subsystem identified in one of the Discovery Log records, the NVMe layer uses the FC-NVMe layer to establish a session with the NVNe bubsystem:
 - i) the initiator NVMe_Port ensures there is connectivity to the target NVMe_Port. The information passed to it from the NVMe layer will minimally indicate the VNN and VPN of the target.
 - interact with the FC Name Server to resolve the VNN and VPN and Fabric information to ensure that it has connectivity. A GID_FF query with FC-4 Feature Bits field set to 01h may be used to validate the N_Port supports an NVM subsystem.
 - 2) if there is connectivity, the initiator acquires the N_Port_ID to use for subsequent communication with the target.
 - ii) the initiator NVMe_Port ensures there is a login with the FC target NVMe_Port.
 - NOTE 1 Note: if there is already an active login between the NVMe initiator and target N_Port's, these steps may be skipped:
 - 1) send PLOGI;
 - send PRLI with Type field set to 28h;
 - iii) the NVMe layer interacts with the FC-NVMe layer to create an association and create the initial Admin Queue connection:
 - send Create Association NVMe_LS to the NVM subsystem.
 - iv) the NVMe layer issues a NVMe Connect command via the newly created transport Admin Queue connection. The Connect command is to create the Admin Queue.
 - the Connect command is classified as a write operation (see B.1.3 or B.1.4).
 - v) the NVMe layer may request further NVMe or NVMe over Fabric commands to be processed via the transport Admin Queue connection. The additional commands may perform NVMe over Fabrics authentication or may be NVMe or NVMe over Fabrics commands to get/set properties to configure the newly created NVMe controller instance created by the Admin Queue Connect command.
 - The commands are classified as no-data (see B.1.1), read (see B.1.2), or write (see B.1.3 or B.1.4) operations.

- vi) the NVMe layer determines the number of IO Queues it wants to create on the NVMe controller. The NVMe layer interacts with the FC-NVMe layer to create one or more IO Queue connections. For each IO Queue connection:
 - 1) send Create Association NVMe_LS to the NVN ubsystem.
 - - i) the Connect command is classified as a write operation (see B.1.3 or B.1.4).
 - 3) the NVMe layer may perform additional commands on the newly-created IO Queue and connection, such as authentication commands
 - i) the commands are classified as no-data (see B.1.1), read (see B.1.2), or write (see B.1.3 or B.1.4) operations.
- vii) at this point the NVMe controller is fully operational. The NVMe layer may request further NVMe or NVMe over Fabric commands to be processed via the transport Admin Queue connection or via one of the IO Queue connections.
 - 1) the commands are classified as no-data (see B.1.1), read (see B.1.2), or write (see B.1.3 or B.1.4) operations.
- At this point the Initiator may terminate the association with the Discovery Controller (see C.1.3).

C.1.2 Initiator discovery of direct-attached target NVMe_Ports (no switched Fabric topology)

The following procedure may be used by initiator NVMe_Ports for discovering NVMe over FC devices in a scenario where no switched Fabric is present. Examples are direct N_Port to N_Port or VN_Port to VN_Port topologies.

Depending on the specific configuration and the management requirements, any of the following steps may be omitted and may be performed using actions outside this standard or the referenced standards.

- 1) Sond PLOGI;
- 2) and PRLI send PRLI with Type field set to 28h;
- If the PRLI did not succeed, the other endpoint does not support FC-NVMe and communication is stopped.
- 4) If FC-NVMe is supported and the returned Feature bits indicate support for NVMe Discovery Service:
 - i) the steps in C.1.1 step 6, i may be followed to create an association with the Discovery Service and obtain the Discovery Log records on the device.
- 5) During operation, the NVMe layer chooses to communicate with an NVM subsystem identified in one of the Discovery Log records. Therefore, the NVMe layer uses the FC-NVMe layer to establish a session with the NVN ubsystem:
 - i) the initiator NVMe_Port ensures there is connectivity to the target NVMe_Port. The information passed to it from the NVMe layer will minimally indicate the VNN and VPN of the target NVMe_Port.
 - 1) the VNN and VPN must correspond to the other FC endpoint and the Fabric information must correlate to a direct-connection.
 - 2) if there is connectivity, the initiator shall have the N_Port_ID to use for subsequent communication with the target.

- ii) the steps in C.1.1 step 8, ii through step 8, vii may be followed to create an association and enact communication with the NVM subsystem.
- 6) At this point the Initiator may terminate the association with the Discovery Controller (see C.1.3).

C.1.3 NVMe association termination

The NVMe layer may encounter conditions which causes it to ninated the association. (e.g., error recovery, controller reset, or no longer needing connectivity to the NVM subsystem). If the NVMe layer decides to terminate the association, it uses the FC-NVMe layer to terminate the service by processing the following steps:

- 1) send Disconnect NVMe_LS to the associated NVMe_Port. The Disconnect NVMe_LS parameters indicate to terminate the association;
- the target NVMe_Port receives the Disconnect NVMe_LS and generates the Disconnect NVMe_LS response;
- 3) the transport association and all connections for it are terminated; and
- 4) if this was the only association between the initiator NVMe_Port and target NVMe_Port, the login may be terminated:
 - i) send LOGO to the FC-NVMe target.

C.1.4 Initiator RSCN reception

During operation, the initiator NVMe_Port may receive a RSCN for the N_Port which supports the NVMe Discovery Service:

- 1) the FC layer processes the RSCN;
- 2) the FC-NVMe initiator communicates the potential change notice to the NVMe layer; and
- 3) the NVMe layer may eat steps in 13.b to obtain an updated Discovery Log from the NVMe Discovery service on the N_Port_ID that generated the state change.

Annex D (informative) Error detection and recovery examples

D.1 Overview

s informative annex diagrams various error detection and recovery procedures for NVMe_Ports conforming to this standard. The conventions for the diagrams are shown in table D.1.

Table D.1 - Diagram conventions

Convention	Meaning
